

IN4MATX 133: User Interface Software

Lecture 11:
Separation in Angular &
Modeling human performance

Professor Daniel A. Epstein
TA Eunkyung Jo
TA Lucas de Melo Silva

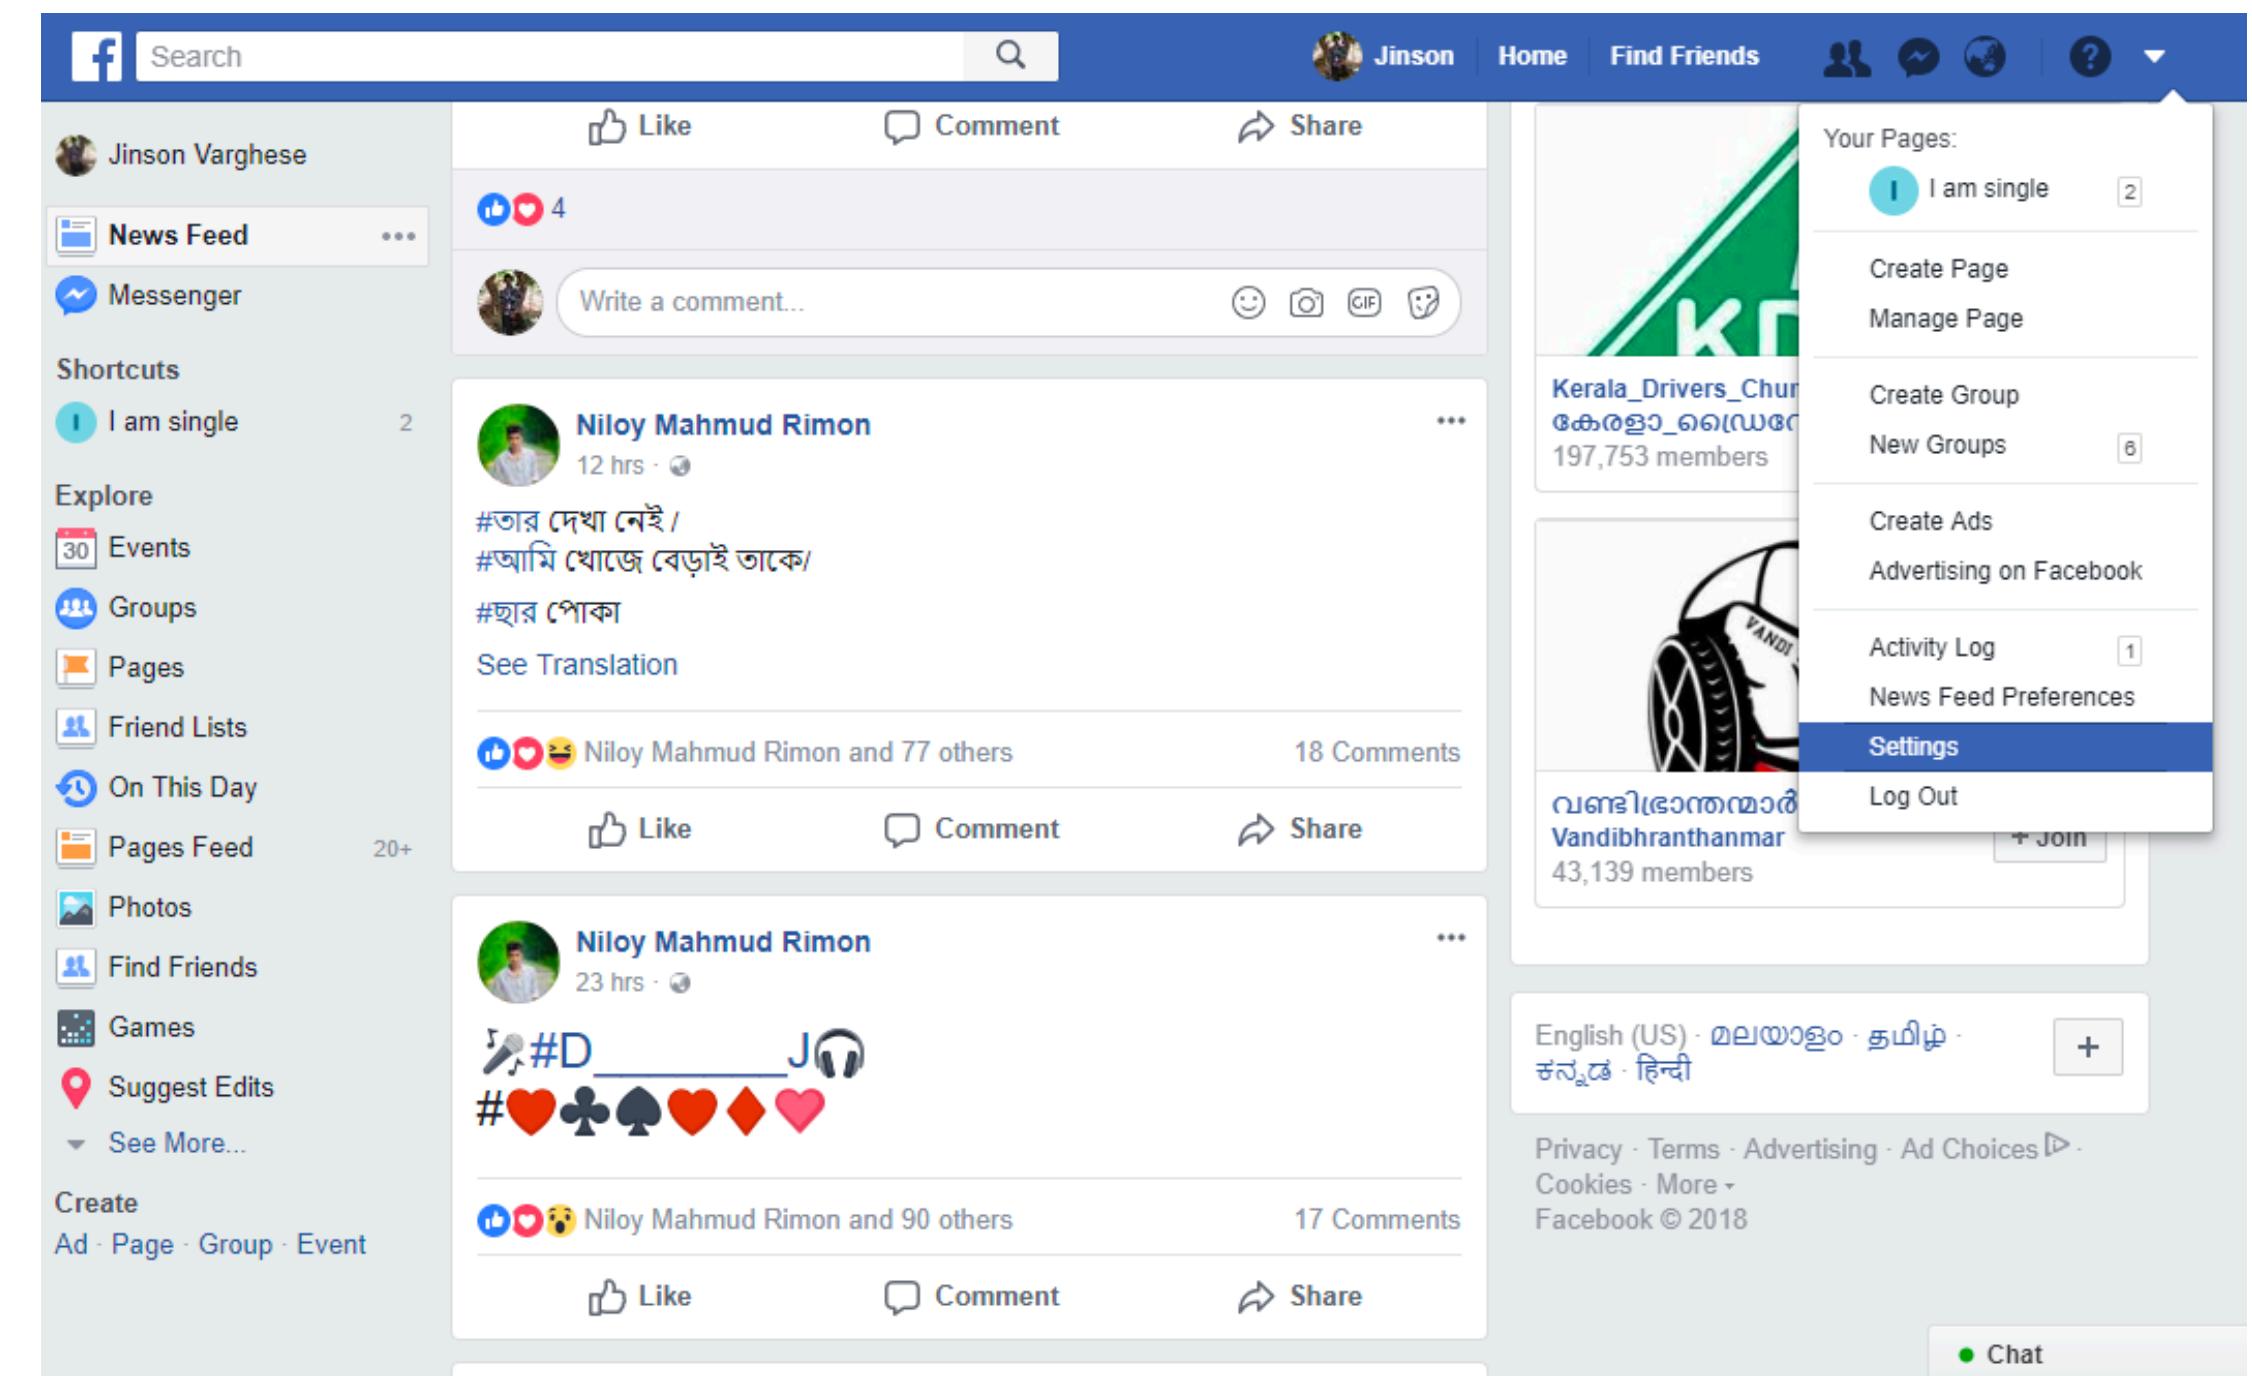

Today's goals

By the end of today, you should be able to...

- Differentiate and explain the roles of Angular components, modules, and services
- Implement a service in Angular
- Navigate Angular's file structure
- Describe the major components of Fitts's Law
- Explain how Fitts's Law impacts how interfaces should be designed
- Describe approaches for correcting systematic errors in touch performance

A “large” client interface

- Hundreds of pages and ways to navigate between pages
- Repeated UI elements (status updates)
 - Angular implements these as *components*
- Different content, links, etc. displayed for each person

A “large” client interface

- Loading lots of libraries can be slow and expensive
- So Angular supports sectioning parts of projects into distinct modules

Angular modules

- Segment code into a library, similar to a JavaScript library
- A component only imports the modules it needs

Angular modules

- By default, each Angular app has one module, `app.module.ts`
- But an app can create multiple modules to section off code
 - `ng generate module [name]`
- Modules can *import* other modules
- Modules also *declare* which components they use
 - When you create a new component (`ng generate component [name]`), it automatically gets added to the declarations for the root module

Angular modules

```
import { BrowserModule } from '@angular/platform-browser';
import { NgModule } from '@angular/core';

import { AppRoutingModule } from './app-routing.module';
import { AppComponent } from './app.component';
import { HelloComponent } from './hello/hello.component';
import { DayComponent } from './day/day.component';

@NgModule({
  declarations: [ ←Components used
    AppComponent,
    HelloComponent,
    DayComponent
  ],
  imports: [ ←Modules to import
    BrowserModule,
    AppRoutingModule
  ],
  providers: [ ],
  bootstrap: [AppComponent] ←The “root” component of the module
})
export class AppModule { }
```

Angular modules

- `BrowserModule` is included by default
 - Required to run any app in the browser
- When creating an Angular project, can specify whether a *Routing* module should be created
 - Routing: defines what URIs to send to what endpoints
 - For Angular, defines what URIs to send to what components

Angular routing

app-routing.module.ts

```
import { NgModule } from '@angular/core';
import { Routes, RouterModule } from '@angular/router';
import { ArtistPageComponent } from './pages/artist-page/artist-page.component';
import { TrackPageComponent } from './pages/track-page/track-page.component';
import { AlbumPageComponent } from './pages/album-page/album-page.component';
import { HomePageComponent } from './pages/home-page/home-page.component';

const routes: Routes = [
  { path: 'artist/:id', component: ArtistPageComponent}, ←Listens for any endpoint
  { path: 'track/:id', component: TrackPageComponent},
  { path: 'album/:id', component: AlbumPageComponent},
  { path: '', component: HomePageComponent}
];

@NgModule({
  imports: [RouterModule.forRoot(routes)],
  exports: [RouterModule]
})
export class AppRoutingModule { }
```

artist/:id
id can be retrieved in
album-page.component.ts

Retrieving route in a component

```
import { Component, OnInit } from '@angular/core';
import { ActivatedRoute } from '@angular/router';

@Component({
  selector: 'app-album-page',
  templateUrl: './album-page.component.html',
  styleUrls: ['./album-page.component.css']
})
export class AlbumPageComponent implements OnInit {

  constructor(private route: ActivatedRoute) {} ←“Injecting a service”

  ngOnInit() {
    var albumId = this.route.snapshot.paramMap.get('id'); ← Retrieve the id
    }                                     from the URI
}

}
```

Angular services

- Anything not associated with a specific view should be turned into a *service*
 - e.g., getting data from an API, parsing URIs for routing information
- Helps keep components lightweight
- Services can then be *injected* into a component (*importing*)
- To inject, import the service and retrieve it as a parameter in the constructor
 - `ng generate service [name]`

Angular services

```
import { Component, OnInit } from '@angular/core';
import { ActivatedRoute } from '@angular/router'; ← Importing a service

@Component({
  selector: 'app-album-page',
  templateUrl: './album-page.component.html',
  styleUrls: ['./album-page.component.css']
})
export class AlbumPageComponent implements OnInit {

  constructor(private route: ActivatedRoute) {} ← Injecting it

  ngOnInit() {
    var albumId = this.route.snapshot.paramMap.get('id'); ← Service can be
    }                                                 referenced later
  }
}
```

Angular services

```
import { Injectable } from '@angular/core'; ←Defined as injectable
import { HttpClient, HttpHeaders } from '@angular/common/http';
↑
@Injectable({
  providedIn: 'root' ←What module(s) can use this service
})
export class SpotifyService {
  baseUrl:string = 'http://localhost:8888';

  constructor(private http:HttpClient) { } ←HttpClient injected

  private sendRequestToExpress(endpoint:string) {
  }
}
```

Import a custom service

```
import { Component, OnInit } from '@angular/core';
import { ActivatedRoute } from '@angular/router';
import { SpotifyService } from '../services/spotify.service';

@Component({
  selector: 'app-album-page',
  templateUrl: './album-page.component.html',
  styleUrls: ['./album-page.component.css']
})
export class AlbumPageComponent implements OnInit {
```

```
  constructor(private route: ActivatedRoute,
  private spotifyService: SpotifyService) { }
```

Inject it like any other service

Import service via file structure

Question

Which of these is best implemented as a *module*, *service*, and *component*?

- (A) (1) Service, (2) Component, (3) Component
- (B) (1) Service, (2) Module, (3) Component
- (C) (1) Service, (2) Module, (3) Module
- (D) (1) Module, (2) Service, (3) Component
- (E) (1) Module, (2) Module, (3) Module

1. A library which communicates with Snapchat's database
2. The interface and packages needed to create and send a Snap
3. The interface and interaction for putting text on a Snapped photo

Question

Which of these is best implemented as a *module*, *service*, and *component*?

- A (1) Service, (2) Component, (3) Component
- B (1) Service, (2) Module, (3) Component
- C (1) Service, (2) Module, (3) Module
- D (1) Module, (2) Service, (3) Component
- E (1) Module, (2) Module, (3) Module

- 1. A library which communicates with Snapchat's database
- 2. The interface and packages needed to create and send a Snap
- 3. The interface and interaction for putting text on a Snapped photo

Angular classes

- Plain-old classes can also be made in Angular
 - Any processing or munging you need to do, for example

- ng generate class [name]

```
export class Dataparser {  
  public constructor() {  
    console.log('Hello, world!');  
  }  
}
```

Import a class

```
import { Component, OnInit, Input } from '@angular/core';
import { Dataparser } from '../dataparser';

@Component({
  selector: 'app-day',
  templateUrl: './day.component.html',
  styleUrls: ['./day.component.css']
})
export class DayComponent implements OnInit {
  @Input() today:string;

  days = ["Sunday", "Monday", "Tuesday", "Wednesday", "Thursday", "Friday", "Saturday"];

  constructor() {
    var data = new Dataparser();
  }

  ngOnInit() {
  }
}
```

 Import class via file structure

 Instantiate it like any other class

Import a library

- Since Angular is in TypeScript, it can use any JavaScript or TypeScript library
- Install as normal with npm: `npm install [packagename]`
 - If you want TypeScript typings, don't forget to install `@types/[packagename]`

Import a library

```
import * as chroma from 'chroma-js'; ←Note: different syntax
```

```
export class Dataparser {  
  
  constructor() {  
    console.log(chroma('royalblue')); // '#4169e1'  
  }  
}
```

↑
Can now be referenced

Angular's file structure

- Angular projects generate a *lot* of files
 - There are about 75 in the starter code for A3
- Most are boilerplate

```
▼ example
  ► e2e
  ► node_modules
  ▼ src
    ▼ app
      ► day
      ► hello
      /* app-routing.module.ts
      /* app.component.css
      <> app.component.html
      /* app.component.spec.ts
      /* app.component.ts
      /* app.module.ts
    ► assets
    ► environments
    □ browserslist
    □ favicon.ico
    <> index.html
    /* karma.conf.js
    /* main.ts
    /* polyfills.ts
    /* styles.css
    /* test.ts
    /* tsconfig.app.json
    /* tsconfig.spec.json
    /* tslint.json
    □ .editorconfig
    ≡ .gitignore
    /* angular.json
    /* package-lock.json
    /* package.json
    <> README.md
    /* tsconfig.json
    /* tslint.json
```

A3 assignment partners

- We're not going to create pairs because there's a long list of properties which go into creating a good match; most of which we don't know
 - Programming background/interest (frontend, backend, user experience, etc.)
 - Schedule and other commitments

Good questions to ask an assignment partner

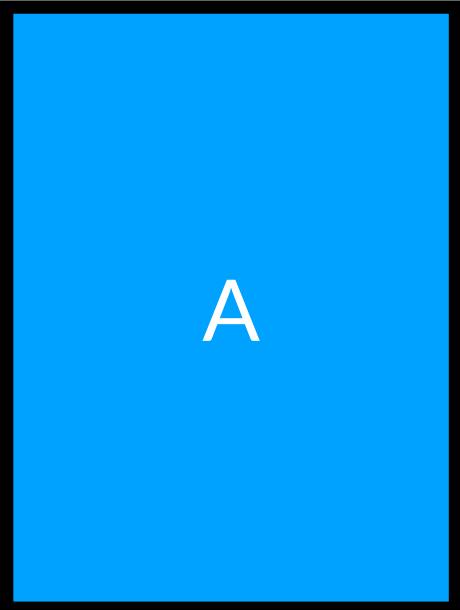

- When do you normally work (morning, afternoon, evening, late evening)?
- What time zone are you in?
- Are you interested in frontend development, backend development, user experience, etc.?
- What's the minimum grade you would be comfortable receiving on this assignment?

Switching topics: Modeling performance

Question

Which button would be faster to click on?

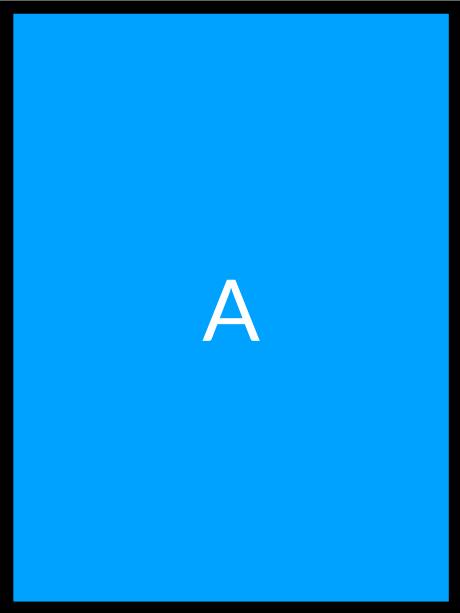

- A
- B
- C Roughly equal
- D
- E

Question

Which button would be faster to click on?

- A
- B
- C Roughly equal
- D
- E

Fitts's Law (1954)

- Models time to acquire targets in aimed movement
 - Reaching for control in a cockpit
 - Moving across a dashboard
 - Pulling defective items from a conveyor belt
 - Clicking on icons using a mouse

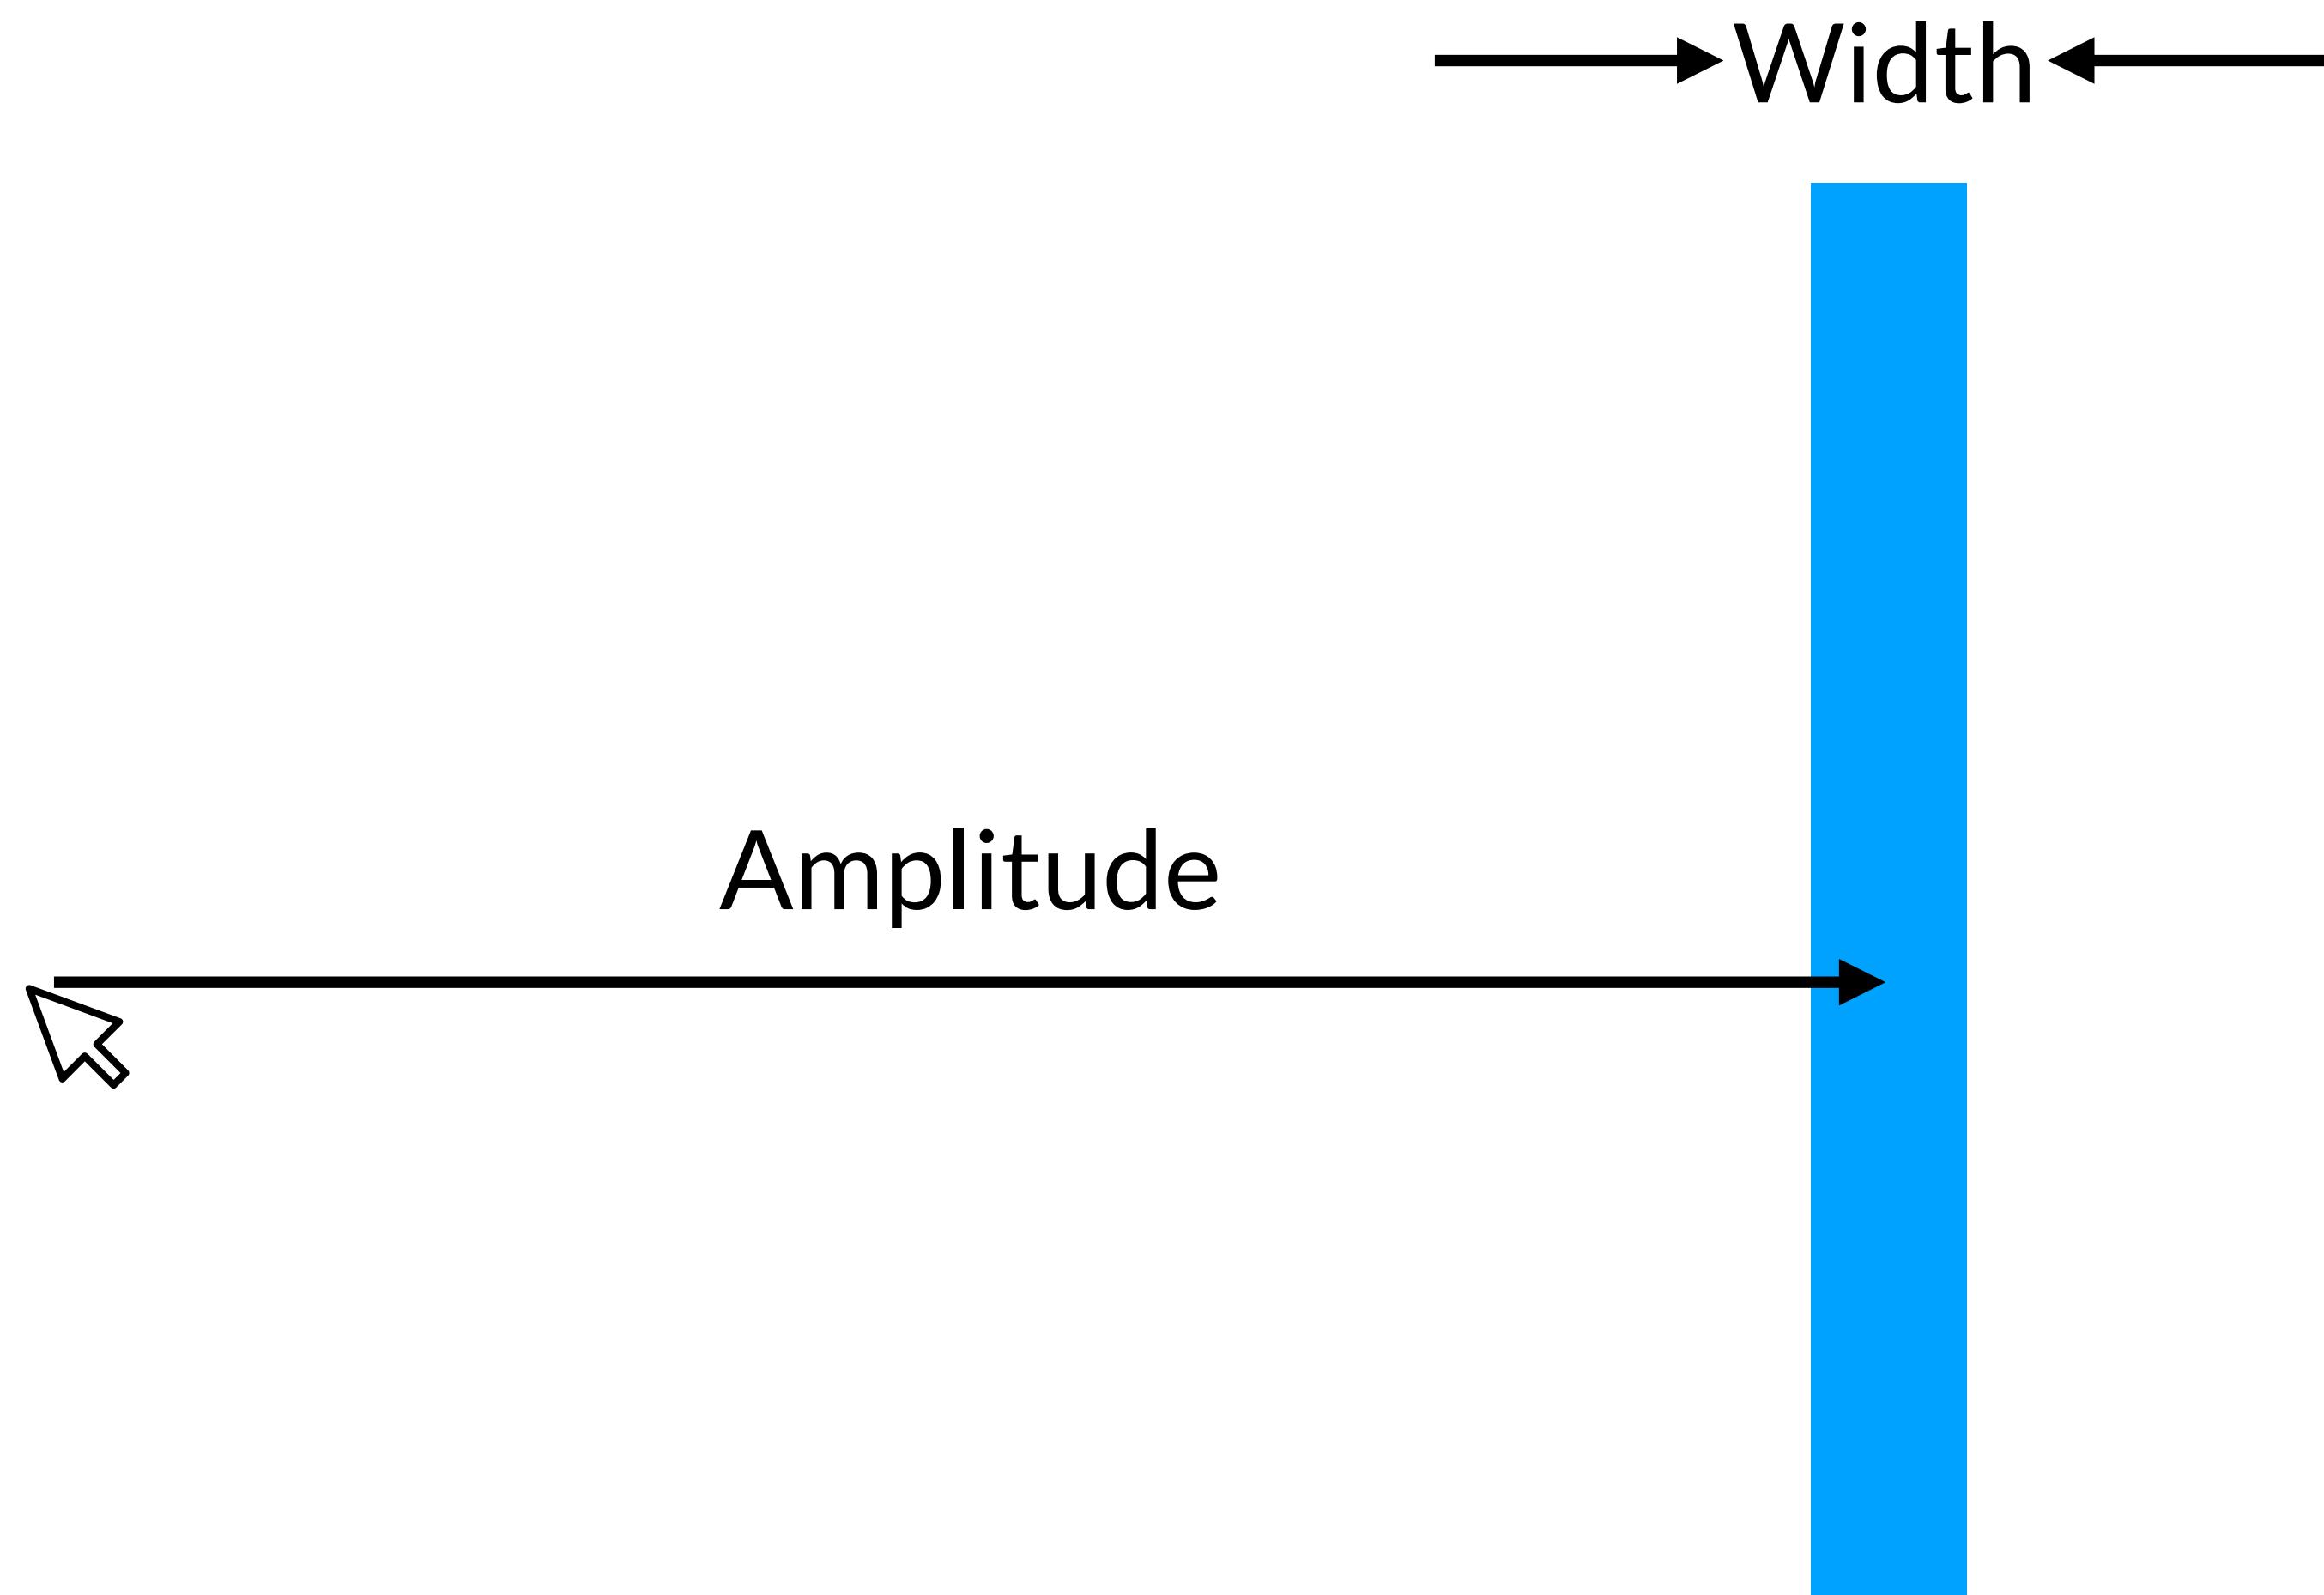

https://en.wikipedia.org/wiki/Fitts%27s_law

Fitts's Law (1954)

- Very powerful, widely used
 - Holds for many circumstances (e.g., under water)
 - Allows for comparison among different experiments
 - Used both to measure and predict

https://en.wikipedia.org/wiki/Fitts%27s_law

Point-select task

Fitts's Law

- $MT = a + b \log_2(A / W + 1)$
 - What kind of equation does this look like?

Fitts's Law

- $MT = a + b \log_2(A / W + 1)$
 - What kind of equation does this look like?
- $y = mx + b$
- $MT = a + bx$, where $x = \log_2(A / W + 1)$
 - x is called the Index of Difficulty (ID)
 - As “A” goes up, ID goes up
 - As “W” goes up, ID goes down

Movement Time (MT)

- $MT = a + b \log_2(A / W + 1)$
- Time, in seconds, to acquire the target (e.g., click on the button)

Index of Difficulty (ID)

- $\log_2(A / W + 1)$
 - Fitts's Law claims that the time to acquire a target increases linearly with the log of the ratio of the movement distance or amplitude (A) to target width (W)

Index of Difficulty (ID)

- $\log_2(A / W + 1)$
 - Fitts's Law claims that the time to acquire a target increases linearly with the log of the ratio of the movement distance or amplitude (A) to target width (W)
- Why is it significant that it is a ratio?
 - Units of A and W don't matter
 - Allows comparison across experiments

Index of Difficulty (ID)

- $\log_2(A / W + 1)$
 - Fitts's Law claims that the time to acquire a target increases linearly with the log of the ratio of the movement distance or amplitude (A) to target width (W)
- ID units typically in “bits”
 - Because of association with information capacity and somewhat arbitrary use of base-2 logarithm

Index of Performance (IP)

- $MT = a + b \log_2(A / W + 1)$
 - b is slope
- $1/b$ is called Index of Performance (IP)
 - If MT is in seconds, IP is in bits/second
- Also called “throughput” or “bandwidth”
- a and b depend on the input device

Question

</> touch

Will a mouse or a touchpad have lower movement time (MT)?

- A mouse
- B A touchpad
- C Roughly equal
- D
- E

[Fitts's law demo]

<http://www.yorku.ca/mack/FittsLawSoftware/>

“Beating” Fitts’s law

- It is the law, right?
 - $MT = a + b \log_2(A/W + 1)$
- So how can we reduce movement time?
 - Reduce amplitude (A)
 - Increase width (W)

“Beating” Fitts’s law

- Put targets closer together
- Make targets bigger
- Make cursor bigger
- Make impenetrable edges

Question

Which menu will be faster on average?

(A) Pop-up Linear Menu

Today
Sunday
Monday
Tuesday
Wednesday
Thursday
Friday
Saturday

- A
- B
- C Roughly equal
- D
- E

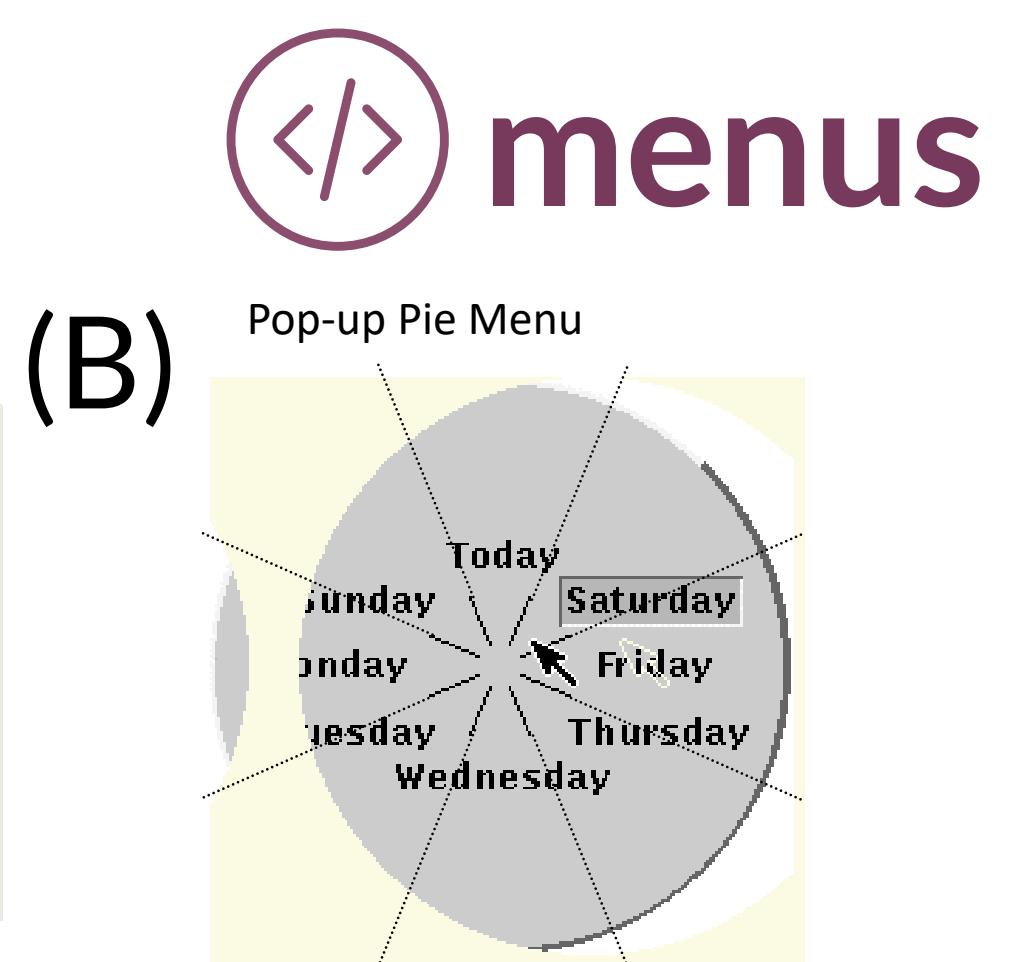

Question

Which menu will be faster on average?

(A) Pop-up Linear Menu

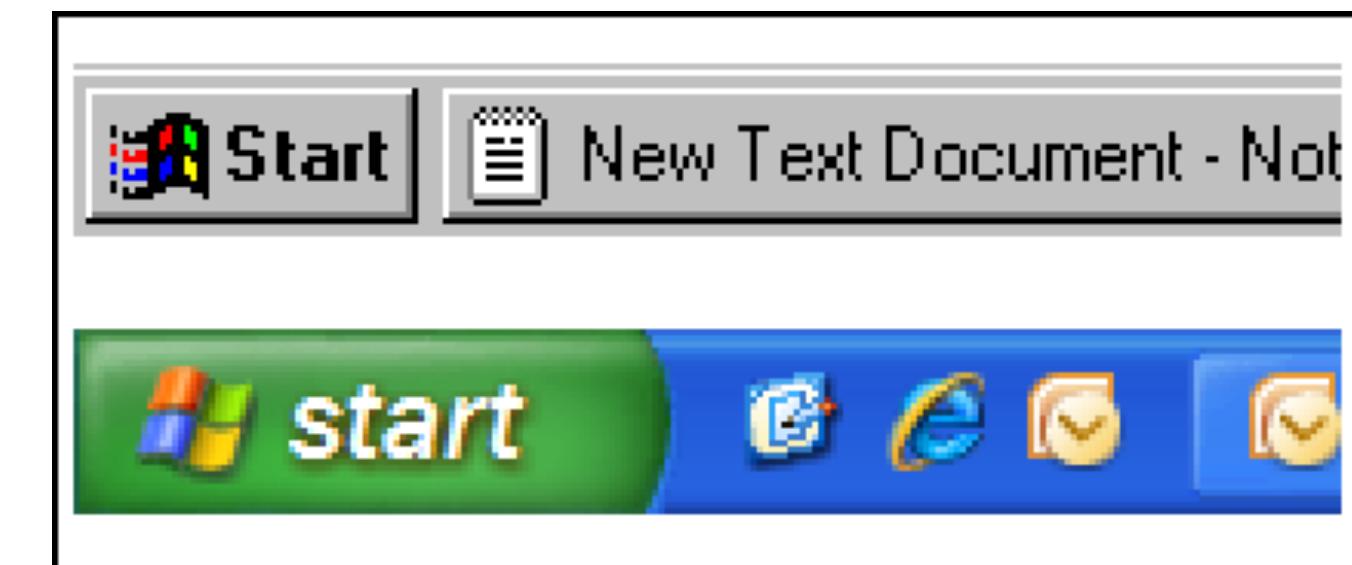

Today
Sunday
Monday
Tuesday
Wednesday
Thursday
Friday
Saturday

- A
- B
- C Roughly equal
- D
- E

Fitts's Law in windowing

- Windows 95: missed by a pixel
- Windows XP: good to the end
- Corners and edges make great targets
 - Do not have to move precisely to trigger them
 - They have “infinite” width

Fitts's Law in other domains

- How would Fitts's Law apply to using touch input on a phone?
 - Shorter distances (smaller screen)
- All things being equal, movement times *should* be lower
 - Shorter distances, faster to move your finger than a mouse

Fitts's Law in other domains

- But in practice, touchscreens on mobile tend not to be much faster
 - Buttons are smaller
 - People tend to be slower near the edges of touchscreens

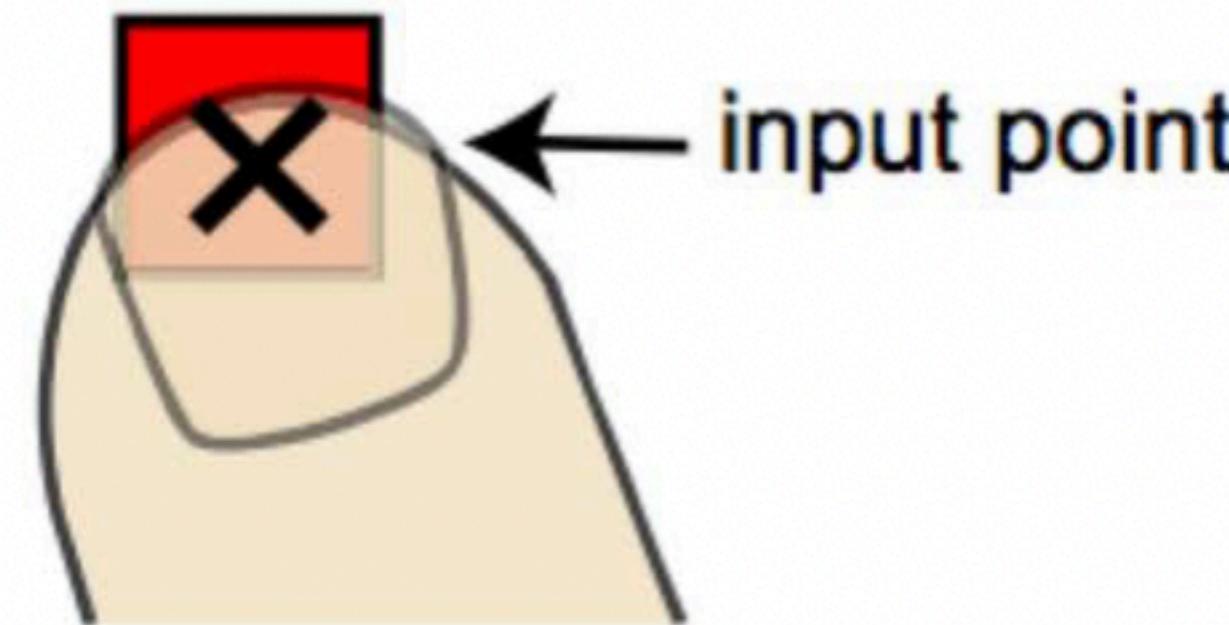

Modeling input

Modeling mouse position

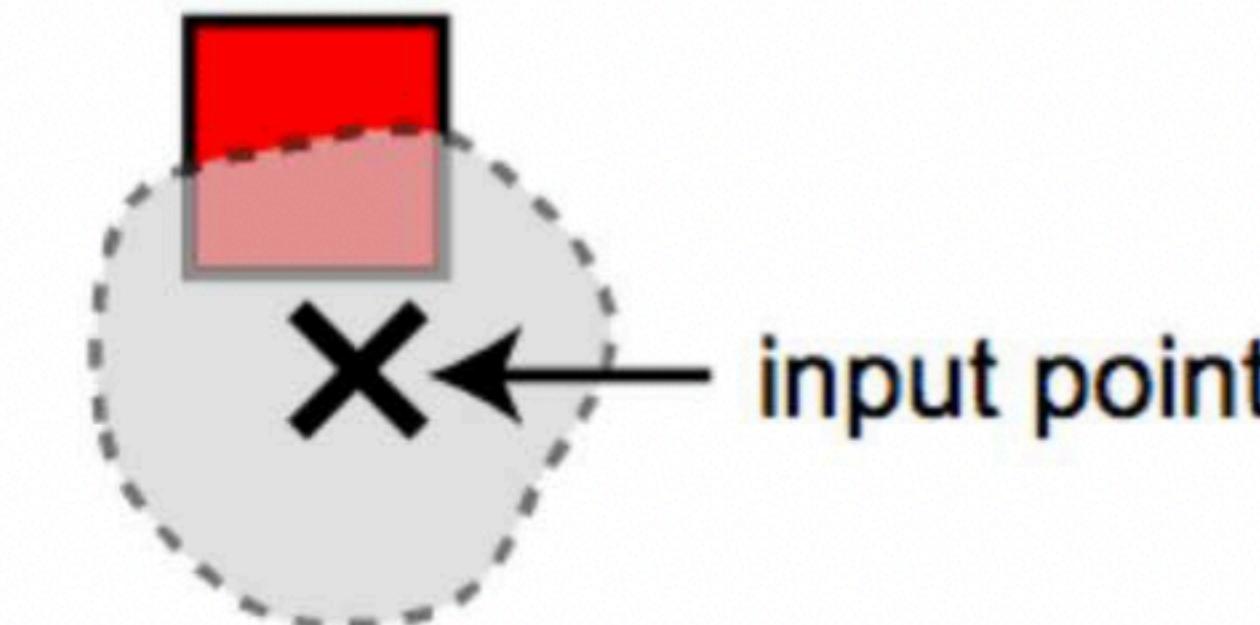

- Mouse pointer is relatively small
- We model it via X, Y position on the screen
- See whether that X, Y overlaps with a button, for example
 - Targets are usually large enough that “exact” position does not matter

Modeling touch position

(a) user view

(b) hardware view

Modeling touch position

- One interpretation of the problem:
our fingers are fat
 - We should use tiny styluses to make our selection more accurate
- Another interpretation:
our model of touch position is inaccurate
 - We should make our model better

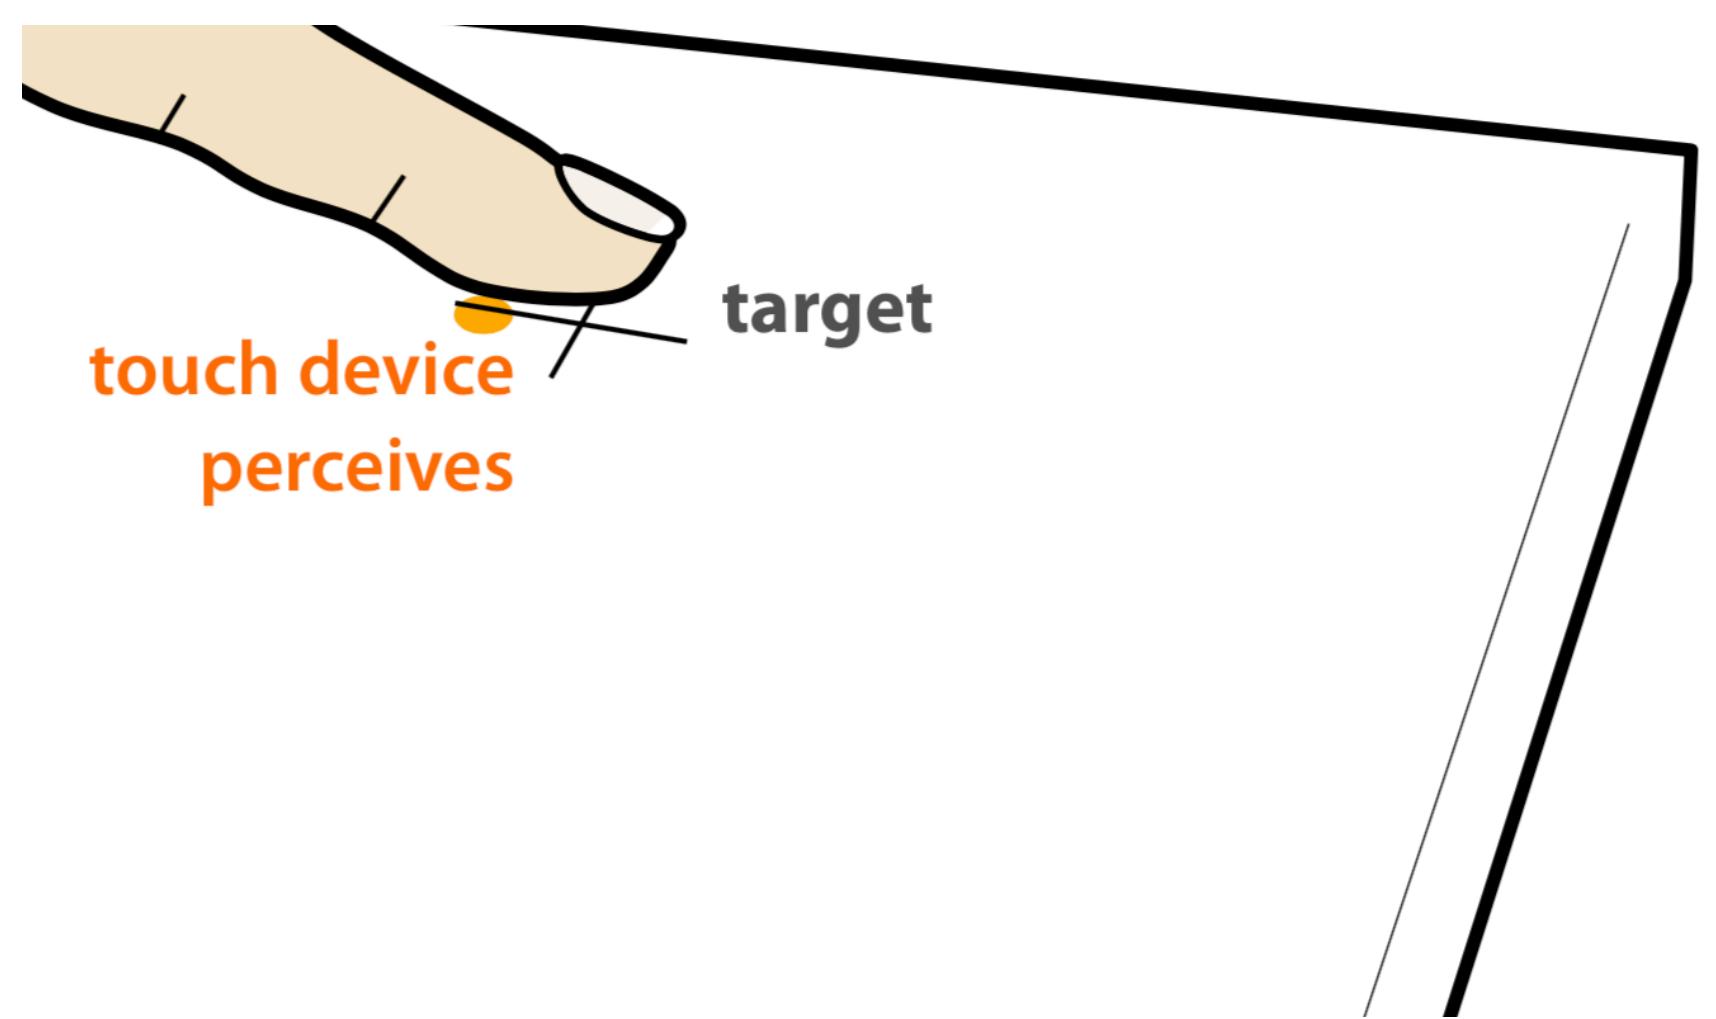

Modeling touch position

- How can we improve our model?
- Make the hardware view more closely match the user view

Modeling touch position

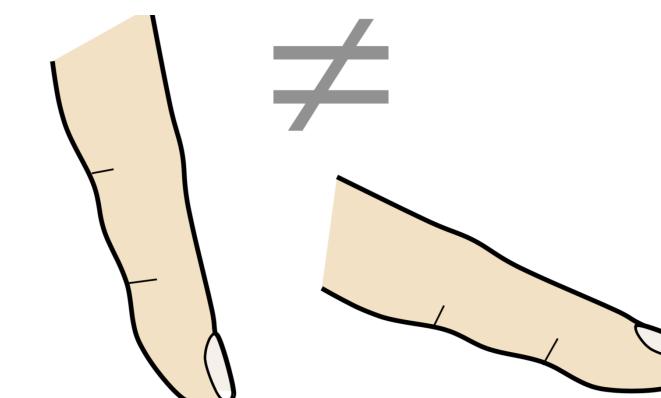

Modeling touch position

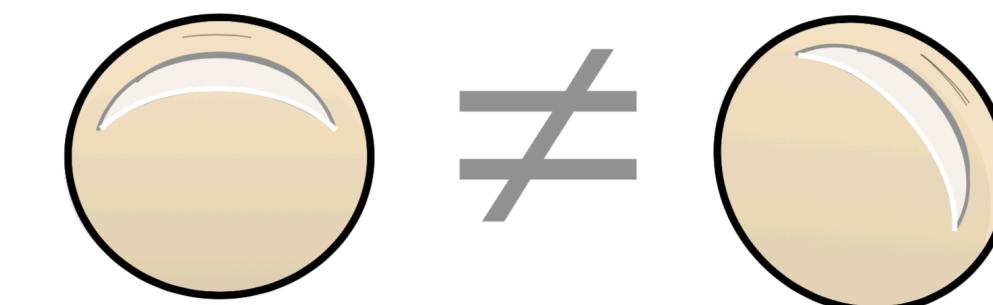

- Hypothesis: yaw, pitch, and roll all impact touch position
 - Additionally, for each person, finger size/shape and mental model impact touch position

Yaw: angle of touch device

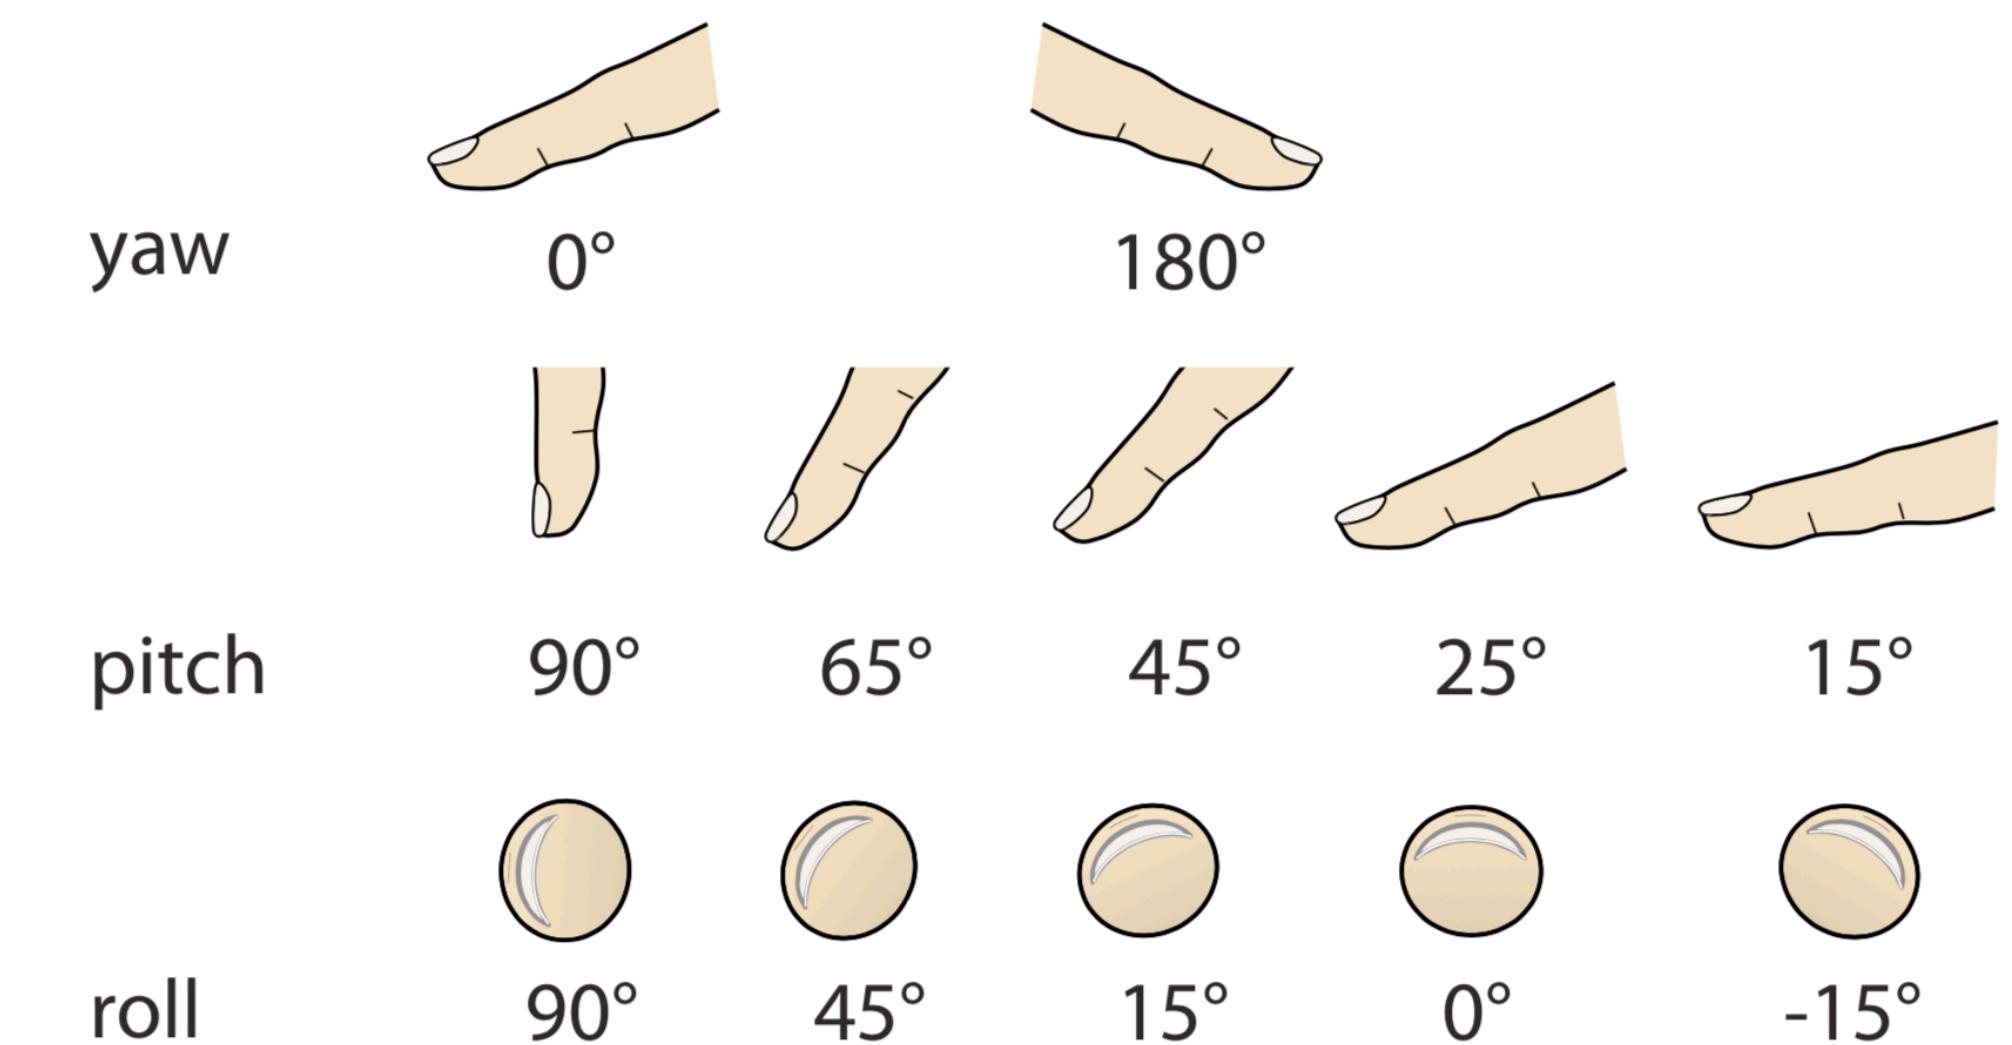

Pitch: angle of finger

Roll: rotation of finger

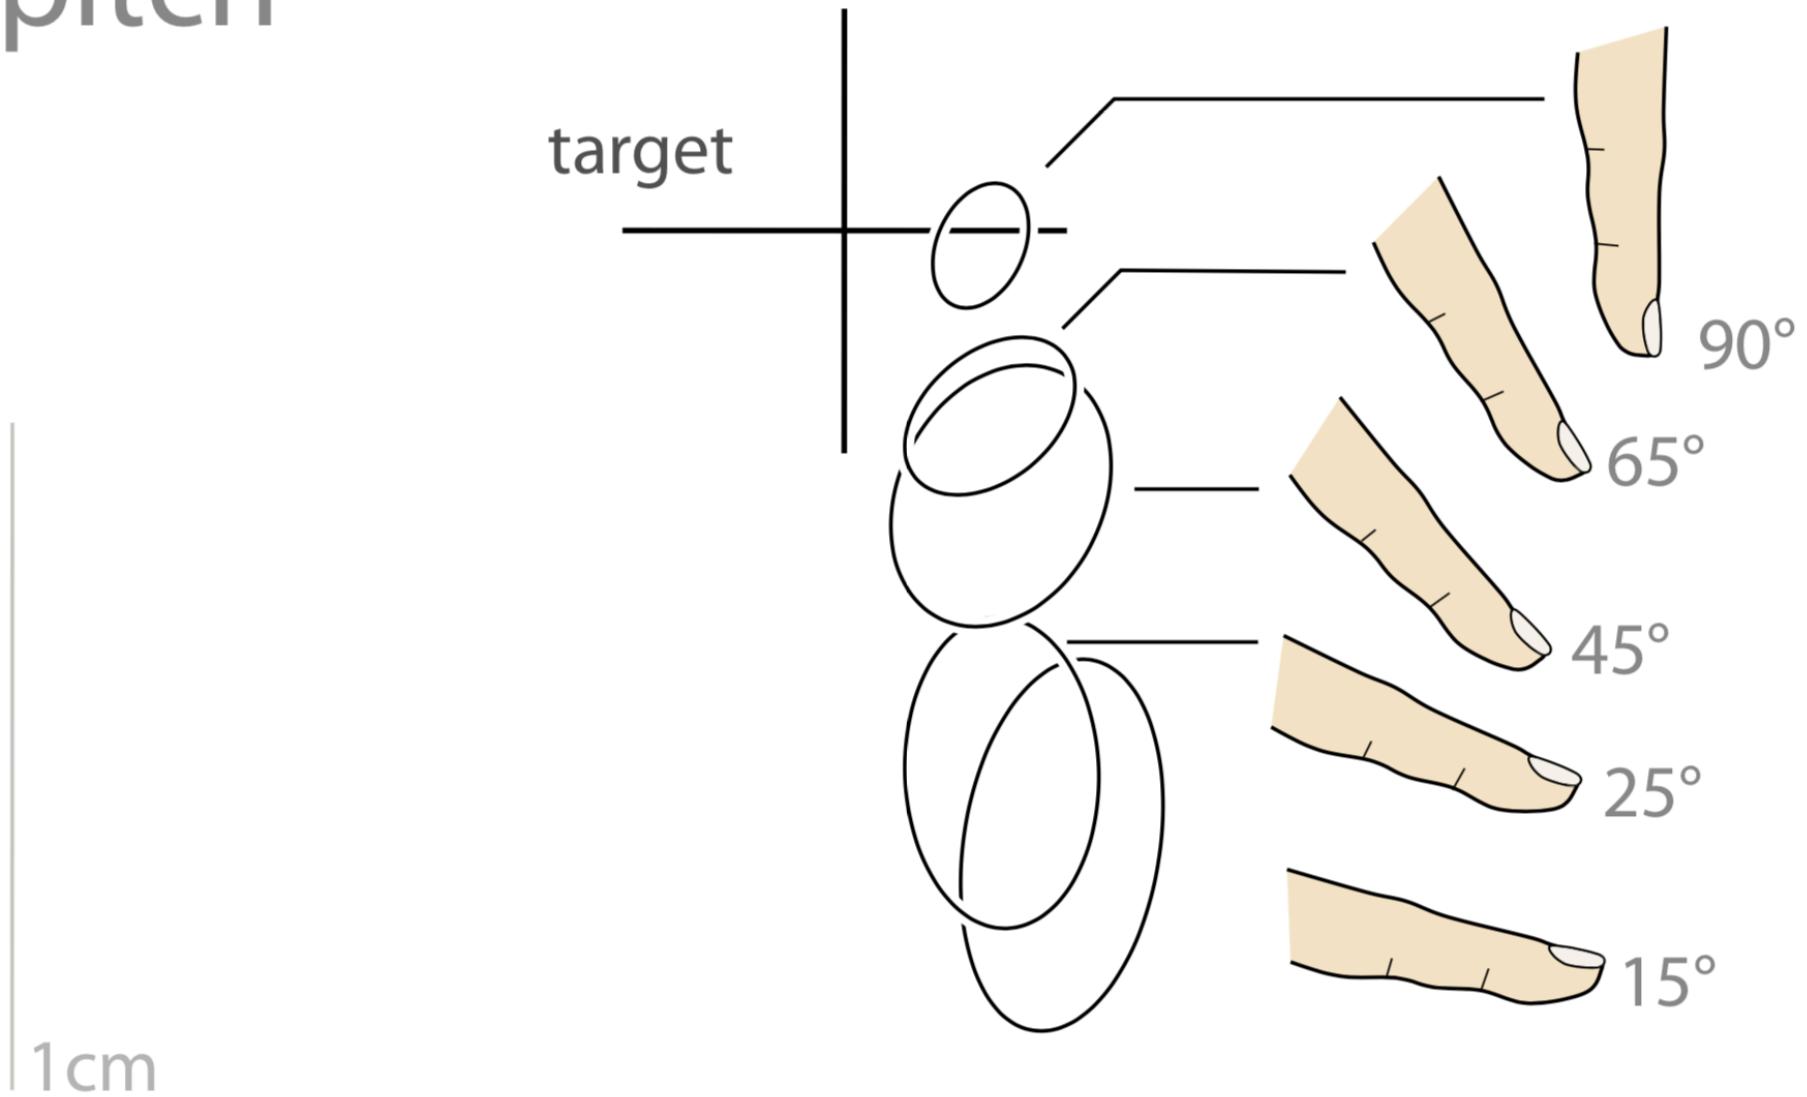

Modeling touch position

- Ran a study
 - 12 participants touched 600 points each
 - Varied yaw, pitch, and roll

Modeling touch position

pitch

roll

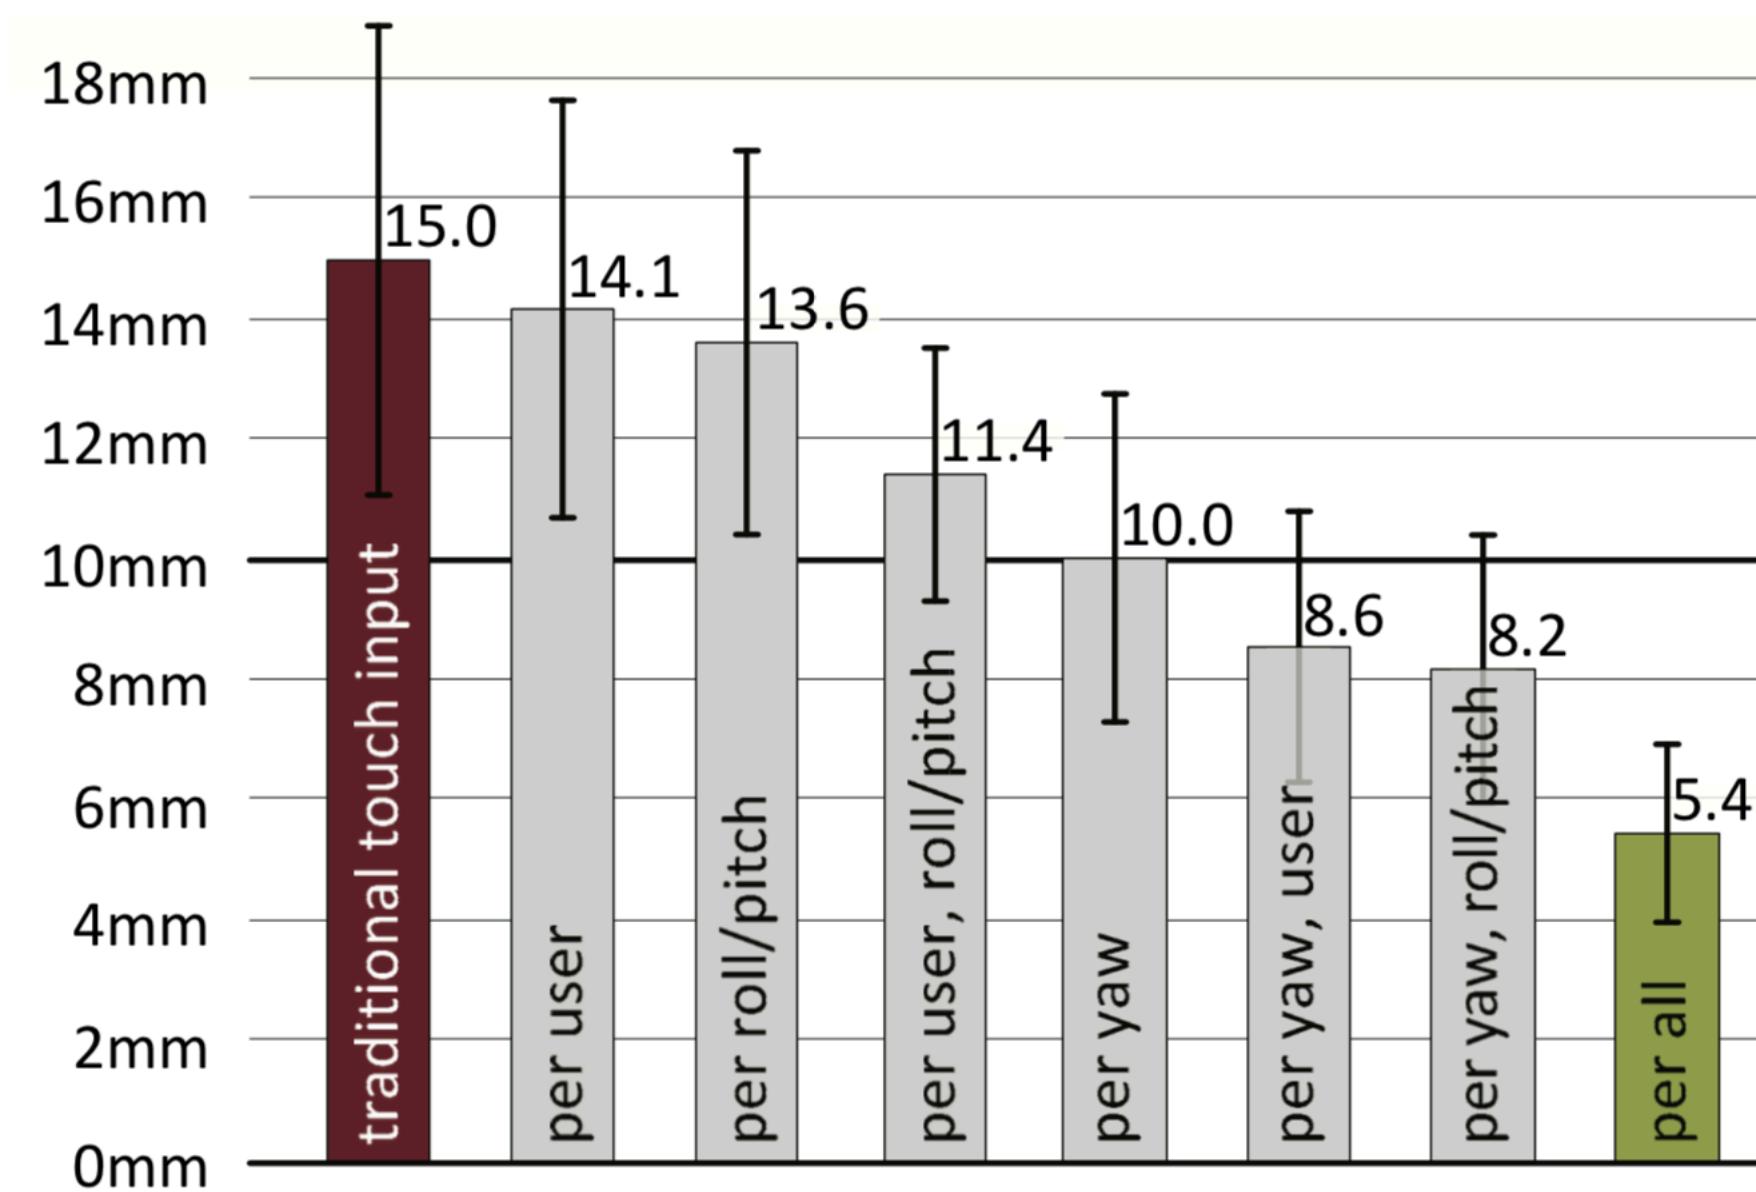

Modeling touch position

user

Modeling touch position

minimum button size

Improving the model means that buttons can be **3x** smaller and not be any harder to click

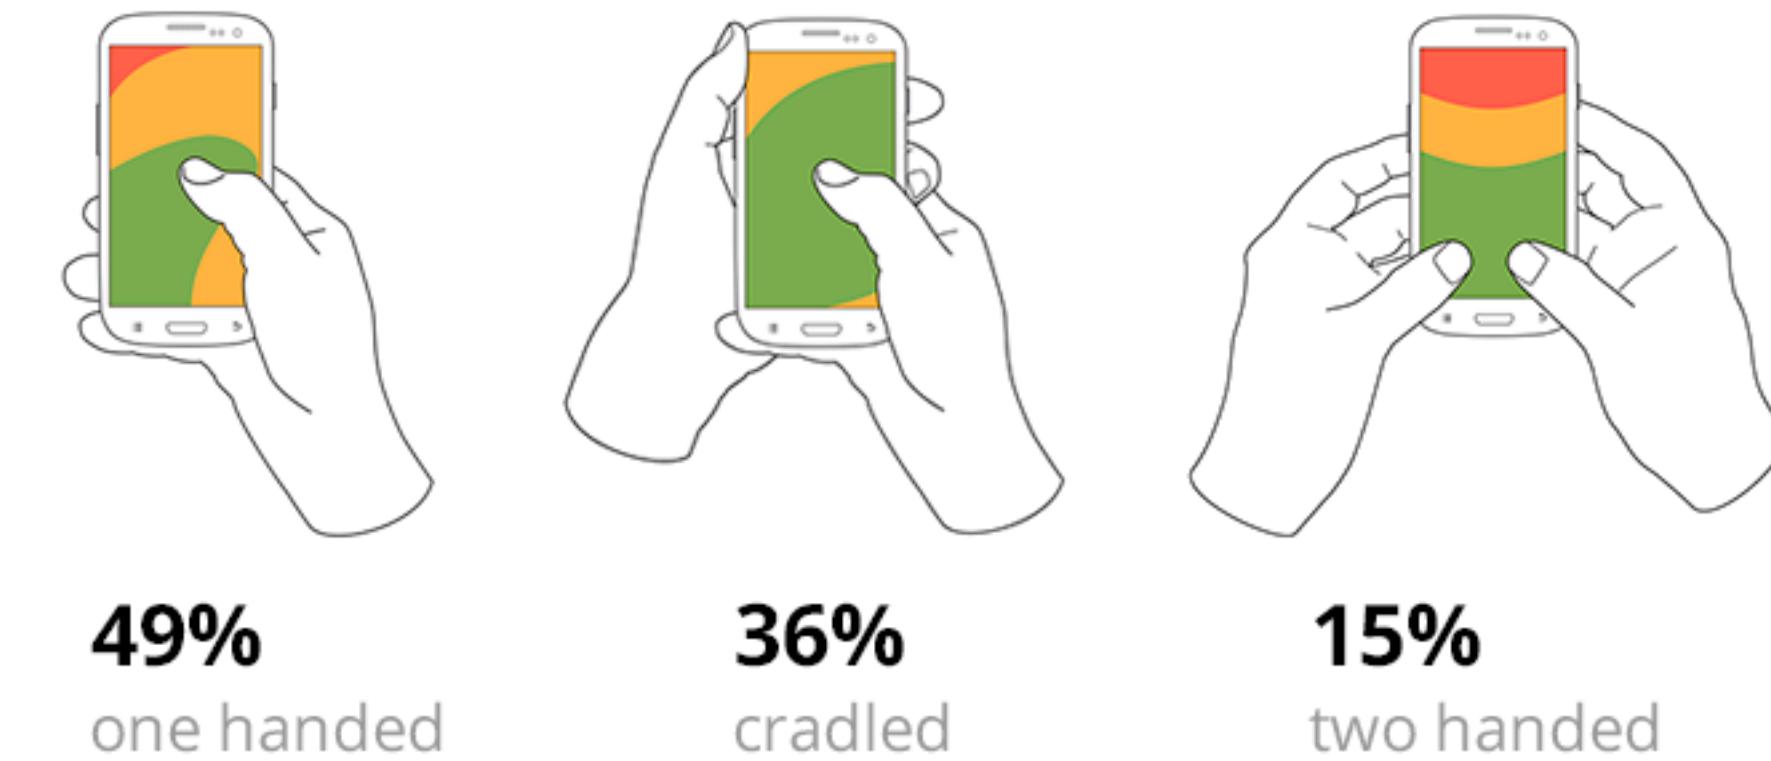

Modeling touch input

- Study was *very controlled*
 - Participant sat in a chair, the screen was on a desk
 - How about the other ways that people use their phones?

Modeling phone grip

- People grip their phones in different ways
- Grip changes with phone size, hand size
 - Situational changes (e.g., walking, holding something)
- Can we detect phone grip and update our model?

http://static.googleusercontent.com/media/www.google.com/en//intl/ALL_ALL/think/multiscreen/pdf/multi-screen-moblie-whitepaper_research-studies.pdf

Detecting phone grip with sensors

Summary

- Modeling helps us measure and predict whether a tool or approach is beneficial for a task
- Fitts's law models time taken to click on a target
 - Demonstrates that larger, nearer buttons reduce time taken
- Improved models lead to higher accuracy
 - Adjust for finger angle and rotation rather than assuming that a user intends to touch with the center of their finger
 - Infer grip using phone sensors to improve typing accuracy

Today's goals

By the end of today, you should be able to...

- Differentiate and explain the roles of Angular components, modules, and services
- Implement a service in Angular
- Navigate Angular's file structure
- Describe the major components of Fitts's Law
- Explain how Fitts's Law impacts how interfaces should be designed
- Describe approaches for correcting systematic errors in touch performance
